

Exercise 1: Implementing the Singleton Pattern

Scenario:

You need to ensure that a logging utility class in your application has only one instance throughout the application lifecycle to ensure consistent logging.

//Logger.java

```
public class Logger {
    private static Logger instance;

    // Private constructor
    private Logger() {
        System.out.println("Logger created!");
    }

    // Public method
    public static Logger getInstance() {
        if (instance == null) {
            instance = new Logger();
        }
        return instance;
    }

    public void log(String message) {
        System.out.println("LOG: " + message);
    }
}
```

//Main.java

```
public class Main {
    public static void main(String[] args) {
        Logger logger1 = Logger.getInstance();
    }
}
```

```

        logger1.log("First log message.");

        Logger logger2 = Logger.getInstance();
        logger2.log("Second log message.");

        if (logger1 == logger2) {
            System.out.println("Both logger instances are
the same (Singleton works!)");
        } else {
            System.out.println("Different logger
instances (Singleton FAILED)");
        }
    }
}

```

Output:

```

TERMINAL  CHAT  powershell + v [icon] ... x

the Singleton Pattern> javac Logger.java Main.java
PS C:\Users\TRAINING-16\Desktop\JAVA FSE 2025\Week - 1\Design Patterns and Principles\Exercise-1 Implementing
the Singleton Pattern> java Main
• Logger created!
LOG: First log message.
LOG: Second log message.
Both logger instances are the same (Singleton works!)
